

파이썬에서 JSON Object 데이터 베이스 (NoSQL)활용하기

구글 Firebase

- 구글에서 제공하는 클라우드 서비스의 일종 :
 - BaaS(Backend as a Service)
- https://firebase.google.com/

Firebase Real-Time Database: NoSQL

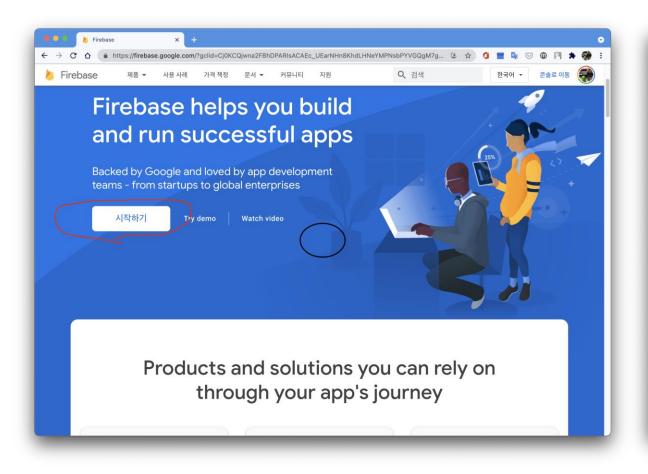

Firebase Real Time Database

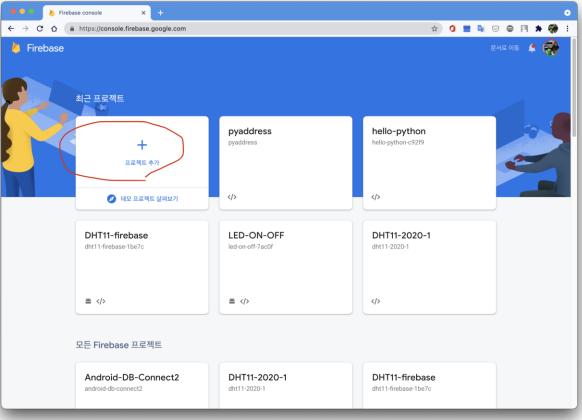

- 구글 클라우드 기반
- JSON 기반
- 빠른 속도
- 웹, 파이썬, iOS, Andriod, Flutter 등 플랫폼에 상관없이 앱 개발 가능

파이썬 연동 Firebase API 모듈 설치

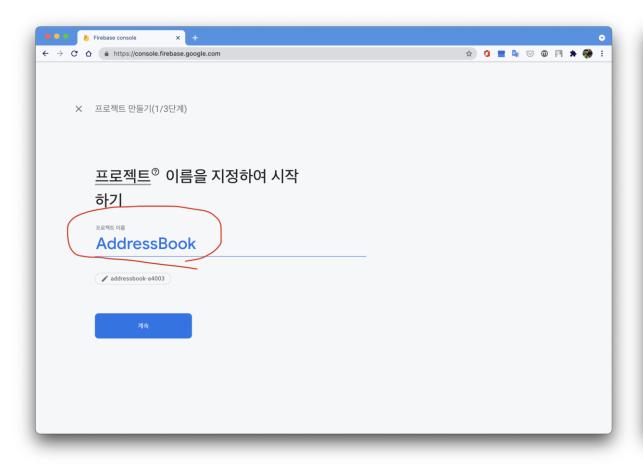

- command line :
 - pip install pyrebase
- 파이참 :
 - Preference -> Project -> Python Interpreter
 - 모듈 추가(+): pyrebase
- import pyrebase

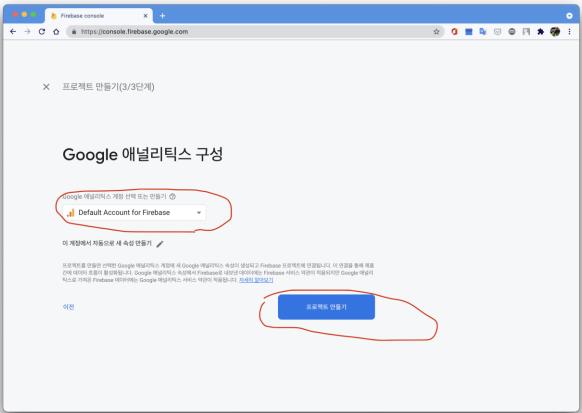

Firebase console -> 새 프로젝트 추가

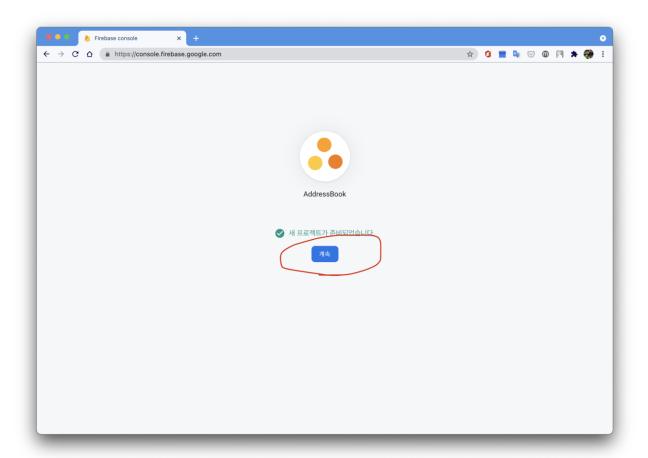

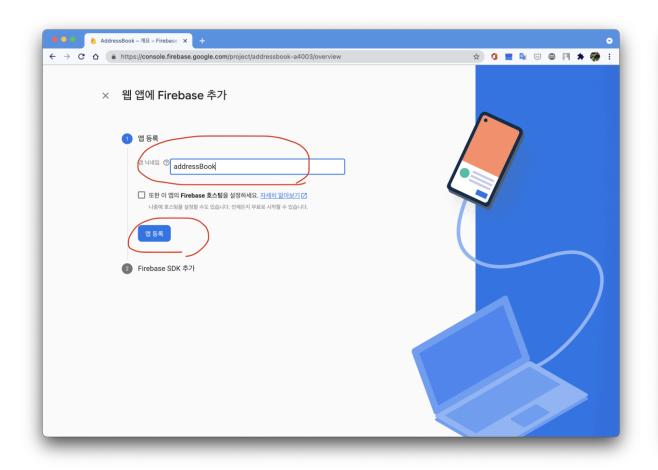

프로젝트 이름 지정

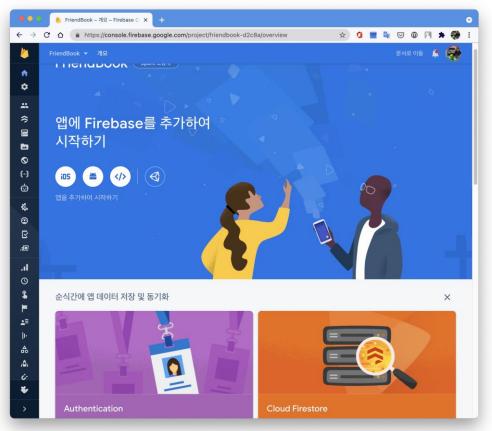

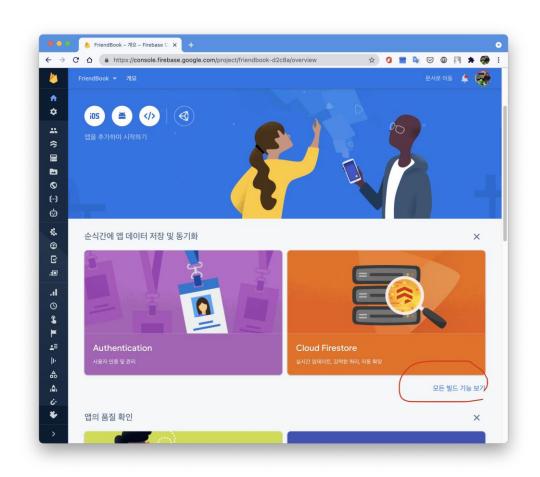

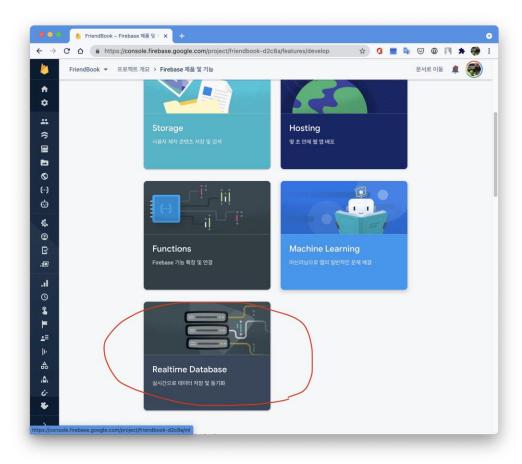

웹 앱에 Firebase 추가

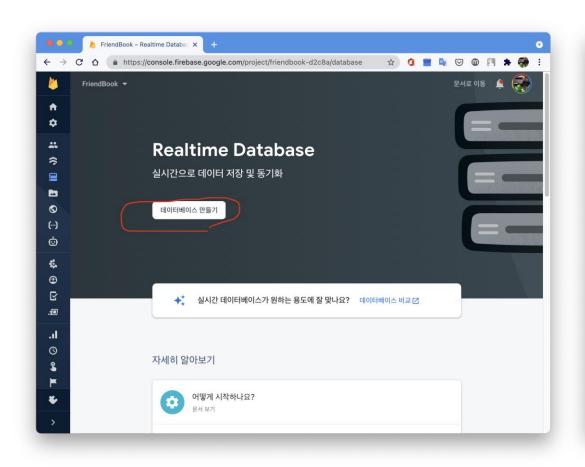

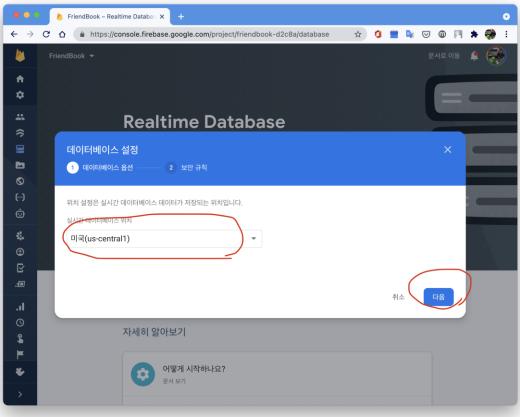

Realtime Database 생성

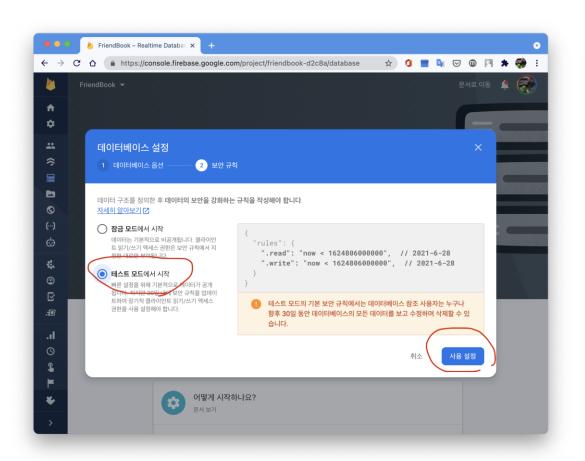

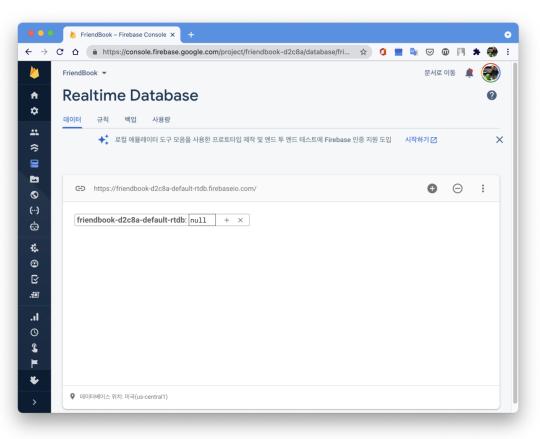

Realtime Database 생성

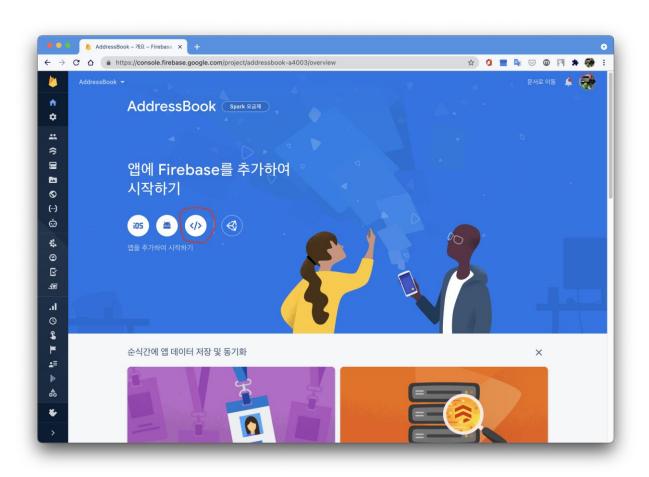

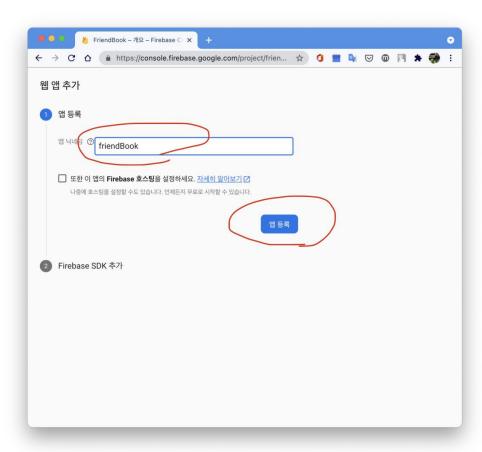

Realtime Database 생성

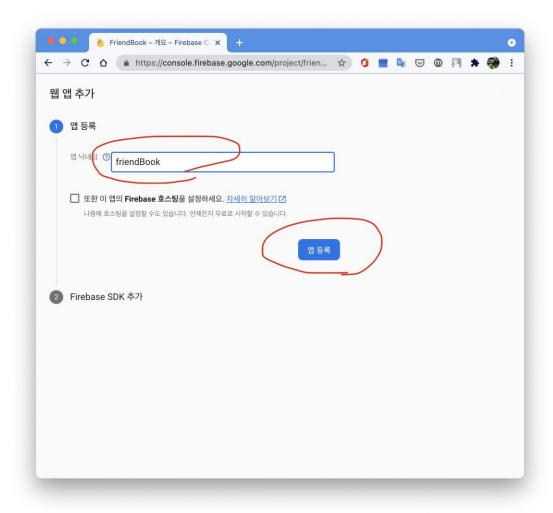

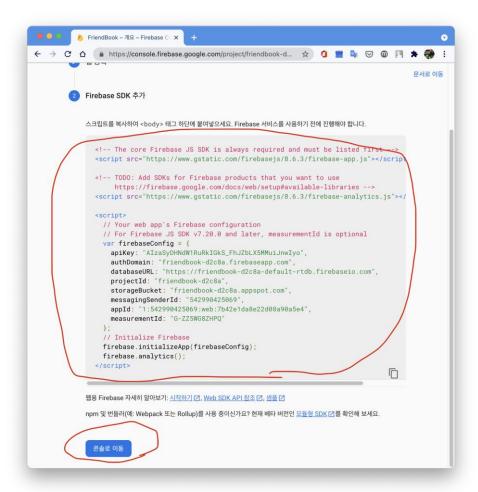

웹 앱에 Firebase 추가하여 시작하기

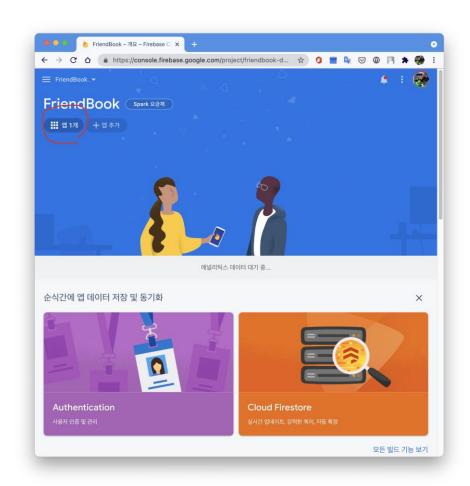

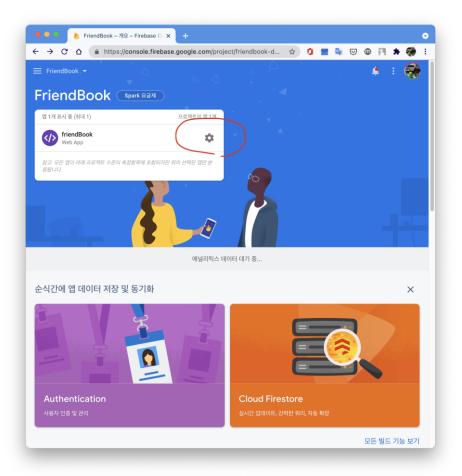

Firebase SDK 추가

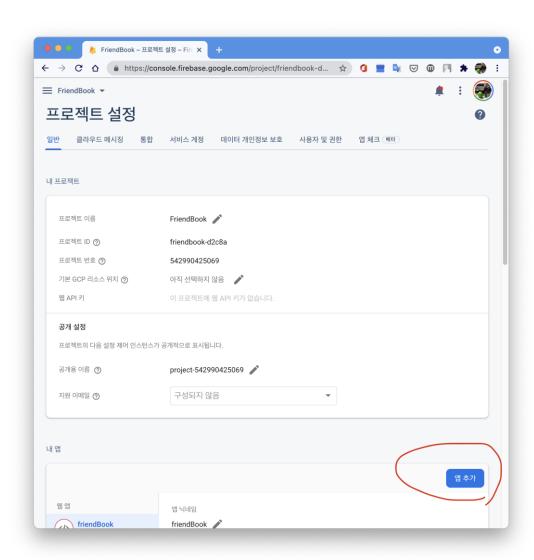

Firebase SDK 추가

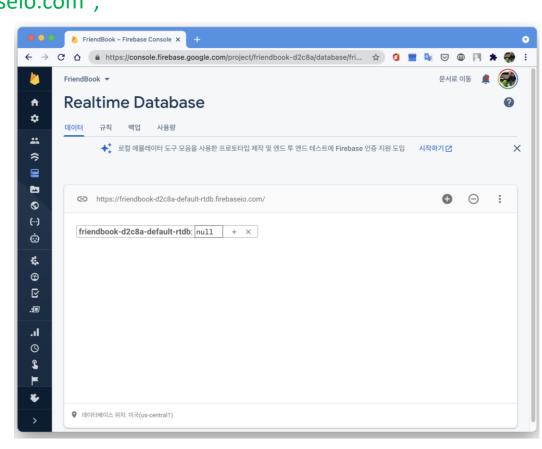

프로젝트 설정

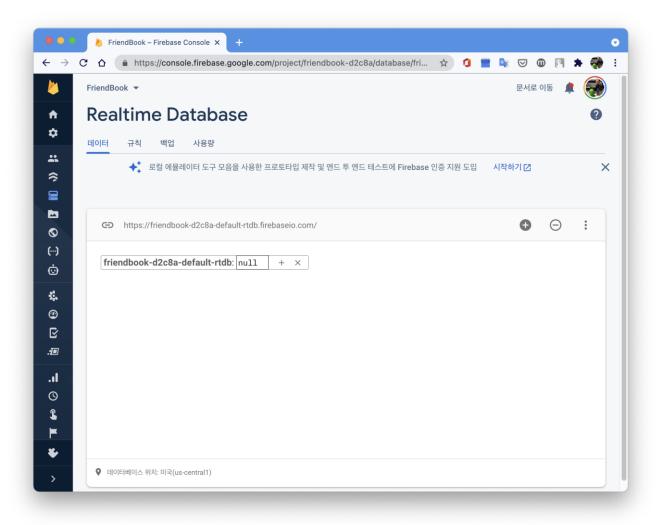

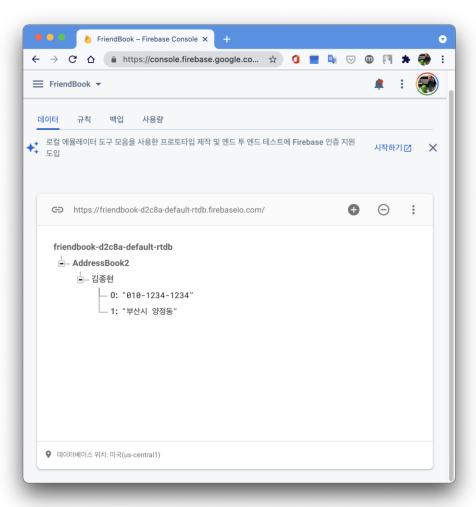

파이썬 Firebase 설정

```
import pyrebase
config = {
   "apiKey": "AlzaSyCP37bKQ3ZXQaos0zBipDCmGigMp6AV9Q",
"authDomain": "hello-python-c92f9.firebaseapp.com",
"databaseURL": "https://hello-python-c2f9-default-rtdb.firebaseio.com",
"projectId": "hello-python-c92f9",
"storageBucket": "hello-python-c92f9.appspot.com",
"messagingSenderId": "765437838021",
"appId": "1:765437838021:web:3781004812462136cda6ac",
"measurementId": "G-11J6FDPS2Z"
firebase = pyrebase.initialize_app(config)
db = firebase.database()
info = ["010-1234-1234", "부산시 양정동"]
# key 생성
db.child("AddressBook2").child("김종현").set(info)
```

파이썬 Firebase 설정

데이터 생성/ 저장

- push()
 - Key가 자동 생성

```
db = firebase.database()
data = {"name":"홍길동"}
db.child("users").push(data)
print("Data updated successfully ")
```

- set()
 - 명시적인 key 사용 db.child("users").child(name").set(data)

데이터 수정 : update

• update()
 db.child("users").child("name").update({"name": " 유관순"})
 print("Data updated successfully ")

db.child("users").child("-LzqIcMVMPaQKVLLjK5d").update({"name":"유관순"})
 print("Data updated successfully ")

데이터 읽기: query

• Object 전체 값 읽기
users = db.child("AddressBook").get()
print(users.val())

• 개별 key(), val() 읽기 all_users = db.child("AddressBook").get() for user in all_users.each(): print(user.key()) print(user.val())

데이터삭제

db.child("users").child("홍길동").remove() print("User removed")
